

Globalisation of activities

In order to offer our customers even more competitive delivery terms and be able to comply with the increasing need for flexible solutions, we have expanded our logistics facilities on a global scale. Missionpharma Logistics, India, is a wholly owned subsidiary company to Missionpharma, located in Kandla, 900 km northwest of Mumbai.

Logistics worldwide

Missionpharma Logistics, India, was founded in November 2001 with the original objective of increasing our kit packing facilities.

Today, our Indian subsidiary is a fully integrated part of the Missionpharma Group with complete packing and storage facilities enabling us to handle the requests of *any* pharmaceutical supply programme within a shorter timeframe.

The foundation of Missionpharma Logistics has facilitated a tripling of our warehouse capacity and has optimised our healthcare distribution to customers all over the world, as we are able to offer:

- Reduced transportation costs
- Reduced delivery time
- Increased warehouse facilities
- Increased packing capacity
- Increased flexibility

Missionpharma Logistics is an integrated part of our GDP- certified organisation.

Core activities

Missionpharma is today one of the world's leading suppliers of medical kits, offering a range of standard kits as well as assistance in developing customer-designed kits.

Whether the request is for medical kits or our traditional pharmaceutical distribution services, all purchase and project management is handled from our Danish headquarters. This ensures full integration of all activities

and a uniform quality of deliveries from any of our facilities.

Quality in all deliveries

Consistency on all levels is achieved on a global scale by implementing a complete standardisation of working procedures in our Danish and Indian warehouses, covering all

aspects of the storage, packing and distribution of pharmaceuticals.

We use an advanced bar code system, which facilitates complete batch tracking and minimises any risk of errors.

Product quality assurance

Our comprehensive quality control system involves more parameters than just the visual control of samples from each consignment. Certificates of analysis are always verified and the technical files of the individual product are continuously evaluated.

In order to ensure that all products meet analytical specifications, they are submitted for independent re-analysis according to our control analysis programme.
